Estimodeling Workflows

- Tekla PowerFab
 - Tekla EPM
 - Tekla EPM Go
 - Trimble Connect
 - Tekla EPM Modeler
- EPM Modeler
 - Parts (Beams, columns, bracing, etc)
 - Connections (Plate, angle, bolts, welds)
 - Reports
 - Project Management tools
- 3D model for
 - Estimating
 - Reports
 - Sequencing
 - Planning/Scheduling

Why model-based estimating?

- Automatically populate material takeoffs
 - WYSIWYG; beams, columns, plate, decking, bolts, welds
 - Model as basic or detailed as you want
- Visualize complex framing
- Identify potential issues earlier
- Model can be passed to detailing/production for use or reference

Sorted by Page in ascending order

Id	Page	Part #	Rev	Comment	Qty	Shape	Dimensions	Length	Grade	Type	Category	Extra	Holes	Finish	Fit System	Carbur
M	1	15	-A3(7)		1	W	16 x 20	28-7	A992	A	BEAM		0	PNT

Methods

- Traditional – create using designs as a guide
- Tracing – import documents (PDF, DWG/DXF) and model over linework to generate 3D model
- Model import – IFC
 - Not all IFC models can be converted – ask for ‘coordination view’

Tools that can help

- Create grid from parts
 - Also works on the IFC file
- Magnetic construction objects
- Organizer – Review and edit converted parts
- Base plate applicator – quickly apply to all
- Autoconnection
 - For design, use partners like Qnect or GIZA

Things to watch for

- IFC not be 'surface geometry' or 'reference' IFC4
- Material grades often missing or incorrect
- Outside IFC connection material does not transfer to Tekla Structures (bolts, welds)
- Naming of objects important for better workflow

Now what?

- Reports
- Organizer
- Fabrication-level IFC
